Name _____

Meet the Invisible Helpers: What Are AI Agents?

Imagine you have a personal helper who can answer questions, organize your schedule, or even suggest music you might like. This helper doesn't sleep, doesn't eat, and can work faster than any human. That's what an AI agent is-a computer program designed to act like a helpful assistant.

AI agents can take in information from their environment, decide what to do, and then act to reach a goal. For example, a map app can suggest the quickest route when there's traffic. A voice assistant can turn on the lights when you ask. These agents are "invisible helpers" because they run quietly in the background, making life easier without us even noticing most of the time.

From answering questions to recommending products, AI agents are becoming a regular part of everyday life. They might not look like robots, but their helpful work is all around us.

Multiple-Choice Questions

1. What is an AI agent compared to in the passage?
