Audience Switch Challenge

When you ask an AI (or a person) to write something, the **audience** matters. A prompt written for a *kindergartner* will look and sound very different from one written for a *scientist* or *teacher.* If you don't say who the audience is, the AI has to guess - and it might give you the wrong kind of answer. By adding clear audience context, you help it choose the right **tone, word choice, and amount of detail.**

Example - Original Prompt: Explain how rainbows form.

Rewritten for Different Audiences:

1. For kindergartners: Explain how rainbows form in simple, colorful language that compares them to magic in the sky.

2. For 5th graders: Explain how rainbows form using light and color vocabulary that's easy for elementary students to understand.

3. For teachers: Explain how rainbows form with classroom examples teachers can use in a science lesson.

4. For scientists: Explain how rainbows form using scientific terms about light refraction, reflection, and wavelengths.

Notice how each version gives the same topic - but the *audience* changes the **tone, vocabulary, and depth** of explanation.

Directions - Below is one prompt. You'll **rewrite it four different ways**, each for a new audience. Think about: A) How much detail each group needs B) What tone or style fits best C) What background information helps them understand

Original Prompt: Describe how plants grow.

Audience	Your Rewritten Prompt
For young children	
For middle school students	
For teachers	
For scientists
