## Human vs. AI Judgment: Who Understands Better? Answer Key

### Scenario 1: The Sarcastic Shopper

**Correct Answer:** A. It didn't recognize sarcasm and only saw the word "great."

**Explanation:**

AI models often rely on keywords. The word "great" looks positive, but humans understand the frustration through sarcasm and context.

### Scenario 2: The Cultural Confusion

**Correct Answer:** A. It took "fire" literally, not as slang for "amazing."

**Explanation:**

AI doesn't automatically understand slang or shifting meanings in culture. Humans know "fire" here means "awesome," not danger.

### Scenario 3: The Double Meaning

**Correct Answer:** A. The AI doesn't understand exaggeration or humor.

**Explanation:**

Phrases like "I literally died laughing" are hyperbole-humans know it's a joke, not a tragedy. AI reads words literally.

### Scenario 4: The Context Clue

**Correct Answer:** A. It misunderstood the phrase as literal violence.

**Explanation:**

AI sees "killed" and flags danger, missing that "killed it" is an idiom for "did great." Humans use context to interpret idioms correctly.
