## Dolphin Communication

**Directions:** Read the passage. Then answer the questions using complete thoughts.

Many ocean animals communicate in special ways, and one of the most fascinating is the **dolphin**. A dolphin can send messages using clicks, whistles, and body movements. Scientists often record these sounds with underwater microphones connected to a **phone** or computer. When the recordings are turned into a **graph**, researchers can study the patterns closely. These patterns help them learn new **facts** about how dolphins travel, hunt, and work together. A single sound or short **phrase** from a dolphin can share important information with the rest of the group.

1. How does a dolphin communicate with other dolphins?

2. What tool do scientists use to record dolphin sounds?

3. What do researchers create to study sound patterns?

4. What can a short dolphin phrase share with the group?
